

Lecture Overview

- 4.1 Student Topic 1 Presentations
- 4.2 PDO and CRUD
- CRUD Lab

Server Side Languages

Web Design & Development

Day 4

Student Presentations

Topic 1

PDO Connections

DSN: Data Source Name - connection string that tells PDO the type of database to access, where to access it, and other parameters.

```
$user="root";  
$pass="root";  
$dbh = new PDO('mysql:host=localhost;dbname=test;port=8889', $user, $pass);  
  
// and now we're done; close it  
$dbh = null;
```

Once \$dbh is instantiated, we can then pass data to/from it.

When you're finished with the database connection, release the object to free resources.

PDO Reminder

- The `prepare()` method prepares a SQL statement for use by the PDO object.
- The `bindParam()` method substitutes in the placeholder values.
- The `execute()` method then runs the completed SQL statement against the datasource.

Sample PDO Prepared Statement

```
$stmt =  
    $dbh->prepare("INSERT INTO REGISTRY (name, value) VALUES (:name, :value)");  
$stmt->bindParam(':name', $name);  
$stmt->bindParam(':value', $value);  
  
// insert one row  
$name = 'one';  
$value = 1;  
$stmt->execute();  
  
// insert another row with different values  
$name = 'two';  
$value = 2;  
$stmt->execute();
```

Exercise 3.2: PDO Select Data

1. Add to your existing “fruits.php” script, and after the input form, echo out the fruits and colors that are listed in the table.
2. Insert a new record into the database - you should see the new row at the bottom of the page when you postback.

```
$calories = 150;
$color = 'red';
$stmt = $dbh->prepare('SELECT name, color, calories
    FROM fruit
    WHERE calories < :calories AND color = :color');
$stmt->bindParam(':calories', $calories, PDO::PARAM_INT);
$stmt->bindParam(':color', $color, PDO::PARAM_STR, 12);
$stmt->execute();
$result = $stmt->fetchAll();
print_r($result);
```

PDO Update & Delete

Update Data

```
$name = 'tangerine';  
$color = 'orange';  
$sth = $dbh->prepare('UPDATE fruit SET color=:color WHERE name = :name');  
$sth->bindParam(':name', $name, PDO::PARAM_STR);  
$sth->bindParam(':color', $color, PDO::PARAM_STR);  
$sth->execute();
```

Delete Data

```
$name = 'tangerine';  
$sth = $dbh->prepare('DELETE FROM fruit WHERE name = :name');  
$sth->bindParam(':name', $name, PDO::PARAM_STR);  
$sth->execute();
```

Questions?

Lab 4: Databases

Refer to FSO Lab4 and Screencast4 for this assignment
